

CA3 User testing

Test 1

User 1: A first-year biology student with eyesight problems.

Task 1: Find the room number for their lecture on the timetable.

Results:

- The student was able to find the room number, but the letters were very hard to see due to the size of the letters and numbers, and it didn't really stand out, and it took the student about less than 2 minutes to find it on the timetable and it costed the student time.
- One thing to improve is the letters of the room and the number to make it easier to see it and notice it.

Test 2

User 2: A fourth-year engineering student who is familiar with companion apps

Task 2: Find their preferred dietary canteen options.

Results:

- The student was able to find their preferred menu options successfully, and it took them only less than 30 seconds to do

so. They were confused at first because there were more options that did not suit them.

- One thing that needs to be improved upon is possibly a specific diet list which allows students which specific dietary requirements they want in their food such as sugar, calories or how much fat is in it.

Test 3

User 3: Third-year accounting student who is colorblind.

Task 3: Use high contrast mode to check for their event time and location.

Results:

- They used high contrast mode to help them see better with colorblindness, and the user was able to navigate the app pretty well. They did have to take more than a minute to get used to the look of the high contrast mode due to how dark it is, but it worked out successfully.
- There are no improvements needed because the user was able to complete the task successfully and the feedback was positive.
